This project aims at understanding the connections between giant Cu porphyry and distal Cu mineralization reported as of manto-type. Targets considered in this project sponsored by the CNRS-INSU/CESSUR program are located in the East Azerbaijan region and along the Kerman Belt. Investigations will include field observation, detailed structural geology, mineralogical characterization and determination of mineralizing fluids. Integration of produced metallogenic model within regional geological evolution is essential for determining key parameters for future exploration project in Iran.
